Okay to set one packer above Metex and Premier and inject into both zones as per verbal approval, Dick Stamets.

Initial injection is to be through the authorized water injection wells with each well equipped with a string of tubing set in a packer located as near as is practicable to the uppermost injection perforation; separation of the injection fluid into the Metex and the Premier zones shall be accomplished through down-hole flow regulators. The casing-tubing annulus shall be loaded with an inert fluid and equipped with a pressure gauge at the surface or left open.
