Okay to set one packer above Metex & Premier and inject into both zones as per verbal approval, Dick Stamets.

Initial injection is to be through the authorized water injection wells with each well equipped with a string of tubing set in a packer located as near as is practicable to the uppermost injection perforation; separation of the injection fluid into the Metex and the Premier zones shall be accomplished through down-hole flow regulators. The casing-tubing annulus shall be loaded with an inert fluid and equipped with a pressure gauge at the surface or left open.
