Re: Well No.1 C. F. Mock
SE NE, 13-18-26
Eddy County, N. M.

Dear Mr. Shettle:

In reviewing our well files we find that there are some reports on the above mentioned well that we do not have. They are as follows: Form C-105, Well Record and Form C-103 Miscellaneous Report, showing all perforating, treating and squeezing that you did on the well, as per the C-102, Notice of Intention to do the above work which was approved on 10/16/58.

I trust that you will help us get the needed information on this well.

Very truly yours,

Oil Conservation Commission

W. A. Gressett

WAG/jw

1. Introduction

The purpose of this study is to investigate the effects of the proposed system on the performance of the system.

The study is organized as follows: Section 2 describes the system architecture. Section 3 describes the experimental setup. Section 4 presents the results of the experiments. Section 5 discusses the conclusions.

2. System Architecture

The system architecture is shown in Figure 1. The system consists of a client and a server. The client is responsible for sending requests to the server. The server is responsible for processing the requests and returning the results to the client. The system is designed to be scalable and flexible.

The system is implemented using the following components:

- Client: A Java application that sends requests to the server.
- Server: A Java application that processes requests and returns results to the client.

3. Experimental Setup

The experiments were conducted on a system with the following specifications:

Processor: 2.4 GHz

Memory: 2 GB
