Injection is to be through the 14 watered water injection wells, each of which shall be equipped with a packer with dual injection down the annulus and a packer with dual injection down the annulus and a packer with dual injection down the annulus and a packer with dual injection down the annulus. It is our understanding that when the injection streams into the two zones will be equal. It is further understood that the majority of the wells have been set to the top of the Premier pay or near the top of the Premier pay. The wells have either no surface casing or only a 12 inch casing. The period for injection down the annulus is to be limited to six months in the Drinnard Well No. 4, the Drinnard Well No. 1, and the Hann Federal Well No. 2 (these wells are 1, 2, and 3, respectively).
