EXTRA COPY

1. The first step in the process of creating a new product is to identify a market need. This involves conducting market research to determine what consumers want and need. Once a need is identified, the next step is to develop a concept for a product that meets that need. This is often done through brainstorming and prototyping. The third step is to create a business plan that outlines the costs and potential revenue of the product. This plan is used to secure funding from investors or lenders. The fourth step is to manufacture the product, which involves sourcing materials and hiring workers. Finally, the product is marketed and sold to consumers. This process can be repeated for subsequent products or improvements to existing ones.
