The elevation of the derrick floor above sea level is _____ ft.

DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudding jobs, cementing points, and all other important proposed work)

This well is to be drilled with cable tools and is to be cored through the Loco Hills sand at approximately 2600 feet, then it is our plan to drill to approximately 3100 feet to test the Metex and the Premier sand zones. If commercial production is found in the Metex or Premier zones this well will be completed in these zones, if production is not encountered in these zones the well will be completed in the Loco Hills sand. The casing and completion program is as follows: Surface pipe to be approximately 410 feet of 28#, 8-5/8" O.D. seamless pipe cemented with 50 sacks. The oil string is to be 14 lb. J55 seamless to be cemented through the pay zones with 100 to 150 sacks. The casing to be perforated opposite the pay zone and the zone is to be treated with fracture treatment. We plan to start drilling this well on October 24, 1957. The plugging bond on this well is the blanket bond in the name of Allen & Fair Operating, Inc.

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.
