The elevation of the derrick floor above sea level is 3495 ft.

DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudding jobs, cementing points, and all other important proposed work)

On October 17 1958 we ran a string of 2" tubing to within a few feet of the bottom of the hole and pumped the hole full of heavy aquagel mud. After waiting getting mud returns at the surface we started to pull the tubing and found it to be stuck. After trying to loosen the tubing for two days we decided to leave it in the hole until such a time as we might decide to drill the well deeper and would move in a larger rig and fish the tubing out. The 85/8" O.D. surface pipe is still in the hole and there is an OCT. tubing head screwed in the top with the tubing packed off. There is 10' of 3" vent line extending from the tubing head and a 2" upset bull plug screwed in the top tubing collar.

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.
