The elevation of the derrick floor above sea level is \_\_\_\_\_ ft.

## DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudding jobs, cementing points, and all other important proposed work.)

Water in this well was encountered at 4300', the hole was then filled with lead wool, steel cuttings and rock from the bottom of the hole to the pipe, which was at 4118. The pipe extending from 2460 to 4118 was filled with a plug consisting of rock, lead wool and steel cuttings.

Mud was poured into the well to 1650' at which place 25 sacks of cement were dumped into the hole. 10 sacks of cement were dumped inside of 200 feet of 3 inch casing and from there to the top of the hole it was filled with mud with 2 sacks of cement on the top. The legal marker, a pipe filled with cement extending 3 feet above the ground marks the hole.

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.
