

10. PLANS FOR RESTORATION OF THE SURFACE (Continued)

- B. Unguarded pits, if any, containing fluids will be fenced until they have been filled.
- C. If the proposed well is non-productive, all rehabilitation and/or vegetation requirements of the Bureau of Land Management and the United States Geological Survey will be complied with and will be accomplished as expeditiously as possible. All pits will be filled and leveled within 90 days after abandonment.

11. TOPOGRAPHY.

- A. The wellsite and access route are located in a gently undulating area on the east bank of the Pecos River overlooking the flood plain.
- B. The topsoil at the wellsite is moderately hard sand, with some "gyp" and rock near the surface.
- C. The vegetation cover at the wellsite consists primarily of prairie grass, mesquite, and greasewood. The wildlife observed was one jackrabbit. It is likely that other typical semi-arid desert wildlife, such as coyotes, gophers, rodents and snakes inhabit the area. The area surrounding the location is used for cattle grazing.
- D. There are no ponds or streams within several miles of the wellsite. The wellsite is situated on the east bank of the Pecos River just up off the flood plain approximately three miles north of Lake McMillan.
- E. There are no occupied dwellings or windmills in the vicinity of the proposed site.
- F. The wellsite is located on federally owned surface.
- G. There is no evidence of any archaeological, historical, or cultural sites in the vicinity of the location.

12. OPERATOR'S REPRESENTATIVES:

- A. The field representative responsible for assuring compliance with the approved surface use plan is:

Stephen P. Baker
District Drilling Engineer
Texas Oil & Gas Corp.
900 Wilco Building
Midland, Texas 79701
