April 21, 1976

6. The casing program will be as follows if all zones are nonproductive of hydrocarbons: at total depth a string of 5 1/2" casing will be run to the top of the Devonian formation and a primary cementing program plus two secondary cementing stages will be induced to insure the returning of the cement to the intermediate pipe at approximately 1000'.
7. During the course of the deepening of this well all information will be readily available to the J. M. Huber Corporation and their final permission for the usage of this hole will determine if and when the undersigned receives a four-acre surface lease around this well for the purposes of salt water disposal only.
8. If commercial hydrocarbons are encountered below the total depth of 9600', the J. M. Huber Corporation may at their discretion take over such operations from Roger C. Hanks and reimburse him for move, rig time, and cost to such point as the J. M. Huber Corporation determines the total depth to be noncommercial *or commercial*.

Your attention to this matter will be greatly appreciated as time is of the essence. I have a drilling rig operating four miles from this area and would appreciate your expediting the matter so I may plan to move the rig to this location and commence the operation.

Respectfully submitted,

Roger C. Hanks
