

9,700': Or top of Morrow formation, add 10 #/barrel KCL to existing mud system and lower the fluid loss below 5 cc with DEXTRID/DRISPAC. Adjust viscosity as needed to maintain a clean hole (use FLOSAI). Maintain mud weight 9.2-9.5 #/gallon with brine additions.

Estimated cost for this program is \$9,000 to \$10,000 without severe loss of circulation or abnormal gas pressures being encountered.

This program is designed to give maximum hole stability and formation protection, rate of penetration and geological data recovery, while maintaining density to control expected formation pressure and reology for hole cleaning while maintaining the ECD as low as possible.
