Re: Big Eddy Unit #41-J, 35-21-28
Eddy County, New Mexico

Reference is made to the "Report (s) Due Notice on the above well.

Due to the excessive amount of water and the low volume of gas produced it is impossible to obtain a back pressure test on this well without killing the well.

A typical 24 hour production is: 137 MCF gas on a 30/64" choke and 8 bbls water with tubing pressure of 885 lbs. This calculates 58.4 bbls of water per MMCF.

Please advise as to what can and should be done in order to satisfy the Commission.

Very truly yours,

W. P. Foster
Sr. Petroleum Engineer

WPF/dh

1-12-76

In view of the problems stated above and the low production of the well, this letter will be accepted in lieu of a 4 point test.

W. A. Gressett
