Cross Over Assembly

Gentlemen:

At the present time the referenced well is now operating as a dual completion with the Wolfcamp flowing through the casing and the Morrow flowing through the tubing.

We propose to blank off the Morrow Zone, pull tubing and go in with a packer and bridge plug and re-treat the Wolfcamp as it was only treated with 500 gallons when it was completed. Attached is a diagram and description of a cross over assembly to be used so that we may flow the Wolfcamp through the tubing and the Morrow through the casing, shut well in and run packer leakage test.

Our justification for this operation is that the Morrow is a dryer gas than the Wolfcamp, we feel if we produce the Wolfcamp through the tubing it will increase the production from 10 to 13 bbls. per day to 35 to 50 bbls. per day of oil and eliminate our parafin problems that we now have between the tubing and the casing.

With the above information we submit this for your approval.

Yours truly,

WESTERN OIL PRODUCERS, INC.
