

10. PLANS FOR RESTORATION OF THE SURFACE.

- A. After finishing drilling and/or completion operations, all equipment and other material not needed for further operations will be removed. The location will be cleared of all trash and junk, to leave the wellsite in as aesthetically pleasing a condition as possible.
- B. Unguarded pits, if any, containing fluids will be fenced until they have been filled.
- C. If the proposed well is non-productive, all rehabilitation and/or vegetation requirements of the Bureau of Land Management and the United States Geological Survey will be complied with and will be accomplished as expeditiously as possible. All pits will be filled and leveled within 90 days after abandonment.

11. Topography.

- A. The wellsite and access route are located in a gently undulating area.
- B. The topsoil at the wellsite is moderately hard sand, with some "gyp" and rock near the surface.
- C. The vegetation cover at the wellsite consists primarily of prairie grass, mesquite, and greasewood. The wildlife observed was one jackrabbit. It is likely that other typical semi-arid desert wildlife, such as coyotes, gophers, rodents and snakes inhabit the area. The area surrounding the location is used for cattle grazing.
- D. There are no ponds, lakes, streams or rivers within several miles of the wellsite.
- E. There are no occupied dwellings within two miles of the location. The nearest occupied dwellings are approximately three miles from the site, one northeast and one southwest of the location.
- F. There is a windmill approximately 900 feet northeast of the proposed drillsite.
- G. The wellsite and access road are located on Federal surface.
- H. There is no evidence of any archaeological, historical or cultural sites in the vicinity of the location.
