The elevation of the derrick floor above sea level is _____ ft.

DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudding jobs, cementing points, and all other important proposed work)

Propose to drill with Rotary Tools from surface to total depth of approx. 4750' in the Abo Formation. We plan to drill to the Penn Formation at a TD of approx. 6250' if the Abo Formation is non productive. Casing program to be approx. as follows:

Size Hole	Size Casing	Approx. Casing Point	Bags Cement
12-1/4"	13-3/8"	60'	75
12-1/4"	9-5/8"	1600'	400
9-1/4"	5-1/2"	4750'	250

The pump & plug process will be used in cementing all strings of casing. Cement will be circulated to surface behind 13-3/8" OD casing. The well will be drilled with air from 60' to 1600' and with mud from 1600' to total depth. If we encounter severe loss of circulation between 1600' and total depth we will then run 7" OD casing from 1600' to total depth instead of the 5-1/2" OD casing. The well will be treated with approx. 3000 gals. of 15% Reg. Acid and 500 gals. Mud Acid.

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.
