The elevation of the derrick floor above sea level is ..... ft.

### DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudding jobs, cementing points, and all other important proposed work)

Plan to drill well to about 2790 ft. for attempted completion in the Delaware Sand. Will spud in with rotary tools set about 150 ft. of 10-3/4" casing as surface pipe and cement to surface. Will bottom at about 2675 ft. to run oil string. Plan to run 5-1/2" 15.5# casing to bottom with a port collar at about 1000 ft. and cement casing in two stages. Will bring cement around shoe to above top of lower salt section (plus or minus 1930') and cement through ports to about 50 ft. above base of upper salt section or plus or minus 700 ft. If possible will complete in open hole, probably with hydrafrac.

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.
