

lined with plastic to prevent seepage. The southwest corner of proposed location is approximately twenty feet higher in elevation than the staked well site; this will necessitate the cutting of the west and south portions of the location and using that material to fill in the lower north and east parts in order to level the location. The estimated amount of cut and fill is approximately 6,000 cubic yards. The proposed location of the well is adjacent to existing road; when the drill pad is constructed, ample roadway will be provided on the west edge of location for through traffic.

10. Plans for Restoration of Surface - within three to four months from the time that drilling operations have been completed, the location and pits will be leveled and reseeded with grass.
11. Other Information - geological features and topography in the area are canyon and mesa, with the proposed location being in the base of the canyon. The soil characteristics are rocky loam with the majority of the rocks being rounded stream-bed-deposit type. The formation lithology of the canyon walls is Seven River-Queen formation, and the base of the canyon consists of stream gravel deposits. Southwestern desert cactus, grass and brush constitute the flora of the area. Visible fauna are rodents, rabbits, small birds and reptiles. Proposed location of all new construction is on Federal land, and the surface usage other than for gas wells is as range land for sheep. An intermittent stream bed lies to the east of the proposed location, but construction will in no way interfere with the stream bed.
