

8. ANCILLARY FACILITIES.

- A. None required.

9. WELLSITE LAYOUT.

- A. Exhibit C shows the relative location, direction, and dimensions of the well pad, reserve pit and major rig components. The pad will be constructed with the longer dimension of the pad running generally in a south-to-north direction, and the pits will be west of the drilling location.
- B. The ground surface in the area surrounding the wellsite is very hilly and irregular, with major variations in surface elevation. The surface of the proposed drilling pad itself is comparatively smooth, with sloping variations in surface elevation estimated to be as much as 14 feet from the lowest elevation on the pad, at the northwest corner, to the highest elevation, at the southeast corner, and with lesser variations in other areas. Measured from the drilling location, it is estimated that cuts of from 2 to 8 feet will be required in the pad and pit area, and that the northwest portion of the pad will require 3 to 6 inches of fill. Material from the area of the cuts will be used as fill in the lower areas.
- C. The reserve pits will be plastic lined.
- D. The pad and pit area has been staked and flagged.

10. PLANS FOR RESTORATION OF THE SURFACE.

- A. After finishing drilling and/or completion operations, all equipment and other material not needed for further operations will be removed. Pits will be filled and the location cleaned of all trash and junk to leave the wellsite in as aesthetically pleasing a condition as possible.
- B. Any unguarded pits containing fluids will be fenced until they have been filled.
- C. If the proposed well is non-productive, all rehabilitation and/or vegetation requirements of the Bureau of Land Management and the United States Geological Survey will be complied with and will be accomplished as expeditiously as possible. All pits will be filled and leveled within 90 days after abandonment.

11. OTHER INFORMATION.

- A. Topography: The proposed wellsite is located in a mountainous area, with deep canyons and generally very irregular surface.
- B. The topsoil at the wellsite is relatively hard sand, underlain with rock.
- C. Flora and Fauna: The vegetation cover in the area is moderately heavy, consisting of ocotillo, holly, cedar, yucca, cactus,
