Undesignated **Eddy** **New Mexico**
(Field) (County or Subdivision) (State or Territory)

The elevation of the derrick floor above sea level is * ft. ***Not yet available. Will be submitted when rig is moved in.**

DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudding jobs, cementing points, and all other important proposed work)

Propose to drill and complete a well in the upper portion of the Delaware Sand at an approximate total depth of 3800', to be drilled with rotary tools, using mud.

8-5/8" OD 24 lb. per ft. new casing is to be set in 12 1/4" hole at least 650' below ground level, and cemented back to the surface with 600 sacks of regular neat cement.

5 1/2" OD 14 #/ft. new casing is to be set on bottom of the 7-7/8" drilled hole at approximately 3650', in the barren sandy shale section that occurs below the first prospective pay, and is about 40' below the top of the Delaware Sand. 4-3/4" hole is to be cored below the 5 1/2" OD casing to examine the lower prospective pay. Depending on results of cores and tests, the well may be completed open-hole below the casing, or the lower zone may be squeezed off, and the upper zone perforated and treated in the conventional manner.

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.
