The Blanco Mesaverde (72319) & Otero Chacra (82329) Pools are Pre-Approved Pools for Downhole Commingling per NMOCD order R-11363. The working and overriding royalty interest owners in the proposed commingled pools are identical, therefore no additional notification is required to be given to interest owners.

Production is proposed to be allocated based on the subtraction method using the projected future decline for production from the Mesaverde. That production shall serve as a base for production subtracted from the total production for the commingled well. The balance of the production will be attributed to the Chacra. Attached is the future production decline estimates for the Mesaverde.

Commingling Production Downhole in the subject well from the proposed Pools with not reduce the value of the total remaining production.

Construct a lined workover pit per BP America – General Drilling/Workover Pit Construction Plan issued date of 04/15/2004. Pit will be closed according to closure plan on file.

Tapp LS 4A Complete into the Chacra and Downhole Commingle with the Mesaverde

Procedure:

- 1. Check anchors. MIRU workover rig.
- 2. Check and record tubing, casing, and bradenhead pressures.
- 3. Blow down well. Kill with 2% KCL water ONLY if necessary.
- 4. Nipple down WH. NU BOPs and diversion spool with 3" outlets and 3" pipe to the blow tank. Pressure test BOPs to 500 psi. Monitor flowing casing pressure with gauge (with casing flowing to blow tank) throughout workover.
- 5. RU slickline unit or wireline unit. RIH and set plug (CIBP, tbg collar stop and plug, or plug set in nipple) for isolation.
- 6. RIH and tag fill, Tally OH with tubing string. Visually inspect tbg while POOH.
- 7. <u>Contingency:</u> If the 2-3/8" tubing is in poor condition, replace entire tubing string.
- 8. RIH w/ bit and scraper for 4-1/2" casing to PBTD at 5071'. Work casing scrapper across old interval, interval for CIBP, and new Chacra interval.
- 9. Set CIBP at +/- 4000'.
- 10. Load well with 2% KCl. Pressure test casing to 2800 psi with rig pumps. 80% of burst is 2992 psi for 7" 20 ppf, K-55 casing.
- 11. RU W/L unit. RIH w/CBL and log from 4000' to top of the liner at 2621'. Confirm that top of cement is not deeper than 2843'. Contact engineer if top of cement is below 2843' to discuss block squeeze.
- 12. RIH with 3-1/8" casing guns. Perforate Chacra formation (correlate to GR log).

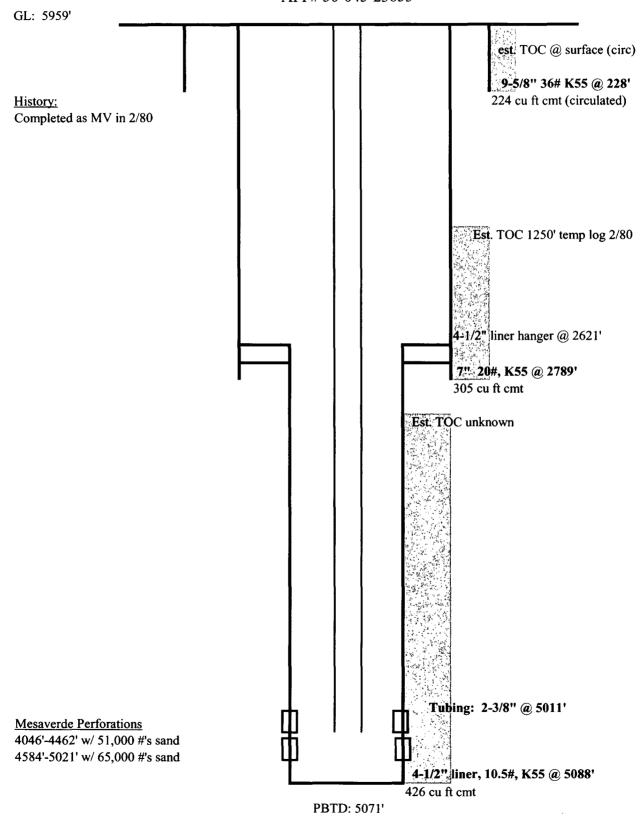

<u>Chacra Perforations, 230</u>'gross, 15 spots @ 4 SPF=60 holes 3534, 3520, 3504, 3490, 3485, 3475, 3468, 3420, 3405, 3395, 3375, 3370, 3365, 3354, 3343'.

- 13. RU tree saver and frac equipment.
- 14. Spearhead 500 gal 15% HCL, establish injection rate, and proceed with fracture stimulation according to Schlumberger schedule. Maintain surface pressures ≤ 2800 psi during frac job. Flush frac with foam. Fill out GWSI scorecard.
- 15. Flowback frac immediately.
- 16. TIH with tubing and bit. Cleanout fill out and flow test Chacra formation at least 4 hours. Then drill bridge plug set at 4000'. C/O to PBTD at 5071'. Blow well dry at PBTD.

- 17. Rabbit tubing and RIH with 2-3/8" production tubing (muleshoe sub, F-nipple, 4 ft pup, X-nipple with plug in place). Fill tubing with water while RIH and test to 500 psi or test with air unit to 500 psi if on location.
- 18. Land 2-3/8" production tubing at +/-5011'. ND BOP and NU WH. During master valve placement ensure the top of hanger has spacer nipple in place to bottom of bonnet flange so plunger equipment will not hang up through tree.
- 19. Swab down tubing or blow dry with air foam unit.
- 20. RU slickline unit. Run gauge ring for 2-3/8" tubing. Pull plug. Flow well up tubing long enough to verify it will not log off. Set tubing stop for plunger. Communicate plunger equipment status to IC room personnel.
- 21. Test well for air. Return well to production.
