NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

packer leakage ten shall be commented on each multiply completed well within days after actual completion of the well, and annually thereafter as prescribed by the authorizing the multiple completion. Such tents shall also be commented on all ple completions within seven days following recompletion and/or chemical or fracturent, and whenever remedial work has been done on a well during which the to or the tubing have been disturbed. Tent shall also be taken at any time that committion is suspected or when requested by the Division.

SUPERVISOR DISTRICT #3

1509 33 71 1

it least 72 hours prior to the commencement of any packer leakage test, the operator northy the Division in writing of the exact time the test is to be commenced. Offset tors shall also be so northed.

The packet leakage test shall commence when both zones of the dual completion are in for pressure stabilization. Both zones shall remain shut-in until the well-head are in each has stabilized, provided however, that they need not remain shut-in more seven days.

for Flow Test No. 1, one zone of the dual completion shall be produced at the normal of production while the other zone remains shut-in. Such test shall be continued for 1 days in the case of a gas well and for 24 hours in the case of an oil well. Note: if, on itial packer leakage test, a gas well is being flowed to the atmosphere due to the lack pipeline connection the flow period shall be three hours.

Following completion of Flow Test No. 1, the well shall again be shut-in, in accorte with Paragraph 3 above.

Flow Test'No. 2 shall be conducted even though no leak was indicated during Flow No. 1. Procedure for Flow Test No. 2 is to be the same as for Flow Test No. 1 except

that the previously produced some shall remain shurein while the some which was previously shur-in is produced.

7. Pressures for gas-some term must be measured on each some with a deadweight pressure gauge at time intervals as follows: 3 hours tests: immediately prior to the beginning of each flow-period, at lifteen-minute intervals during the first because thereof, and at housely intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period, 7-day terms: immediately pint to the beginning of each flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have pre-viously shown questionable test data.

24-hour oil zone teru: all pressures, throughout the entire test, abaall be continuously measured and recorded with recording pressure gauges the securacy of which must be checked at least revier, once at the beginning and once at the end of each test, with a dendweight pressure gauge. If a well is a gas-oil or an oil-gu dual correspliction, the recording gauge shall be required on the oil zone only, with dendweight pressures as required above being taken on the gas sone.

8. The results of the above-described tests shall be filed in triplicate within 13 days after completion of the test. Tests shall be filed with the Aster Distint Office of the New Mexico Oil Conservation Division on Northwest New Mexico Parket Leakage Test Form Revised 10-01-78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas zones only) and gravity and GOR (oil zones only).
