	NOR	THWEST NEWMEXICC) PACKER LEAKAGI	E TEST INSTRUCTIO	NS		
1. A packer leakage test shall be com	menced on each multiply completed we	ell within seven days after actu	ual 6. Flow 1	Fest No. 2 shall be conduc	ed even though no leak was indicated during Flow Test No. 1. Procedure		
completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all multiple completions within seven days following recompletion and/or							
	enever remedial work has been done on shall also be taken at any time that comm		en	res for ass-zone tests mus	t be measured on each zone with a deadweight pressure gauge at time		
requested by the DIVISION.			intervals as	follows: 3 hours tests: im	t be measured on each zone with a deadweight pressure gauge at time nediately prior to the beginning of each flow period, at fifteen-minute and at hourly intervals thereafter, including one pressure measurement		
	mencement of any packer leakage test, e test is to be commenced. Offset opera		immediately flow period	prior to the conclusion of , at least one time during of	'each flow period. 7-day tests: immediately prior to the beginning of each ach flow period (at approximately the midway point) and immediately prior Other pressures may be taken as desired, or may be requested on wells		

3. The packer leakage test shall commence when both zones of the dual completion are shut-in for pressure stabilization. Both zones shall remain shut-in until the well-head pressure in each has stabilized, provided however, that they need not remain shut-in more than seven days.

4. For Flow Test No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains shut-in. Such test shall be continued for seven days in the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage test, a gas well is being flowed to the atmosphere due to lack of a pipeline connection the flow period shall be three hours.

5. Following completion of Flow Test No. 1, the well shall again be shut-in, in accordance with Paragraph 3 above.

which have previously shown questionable test data.

24-hour oil zone tests: all pressures, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be checked at least twice, once at the beginning and once at the end of each test, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil zone only, with deadweight pressures as required above being taken on the gas zone.

8. The results of the above-described tests shall be filed in triplicate within 15 days after completion of the test. Tests shall be filed with the Aztec District Office of the New Mexico Oil Conservation Division on Northwest New Mexico Packer Leakage Test Form Revised 10-01-78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas zones only) and gravity and GOR (oil zones only).
