13. Describe Proposed or Completed Operation (clearly state all pertinent details, including estimated starting date of any proposed work and approximate duration thereof. If the proposal is to deepen directionally or recompleat horizontally, give subsurface locations and measured and true vertical depths of all pertinent markers and zones. Attach the Bond under which the work will be performed or provide the Bond No. on file with BLM/BIA. Required subsequent reports shall be filed within 30 days following completion of the involved operations. If the operation results in a multiple completion or recompleat in a new interval, a Form 3160-4 shall be filed once testing has been completed. Final Abandonment Notices shall be filed only after all requirements, including reclamation, have been completed, and the operator has determined that the site is ready for final inspection.)

This sundry is an amendment to the casing report we submitted dated 5/18/07.

We performed a 2 stage cmt program on the 7" csg and did not have cmt returns on the either stage. We ran a temperature survey after the 2nd stage from surface to 2775' which indicated TOC @ 660'; however, we did not log or run temp survey for the 1st stage. Due to the fact the 4 1/2" csg has been cemented (TOC 2750') we submit the following analysis to support our calculated TOC for 1st stage @ 2779'.

The Casing shoe is at 3598' and the DV tool is at 2779'. Based on the graphs of the pressures while pumping the first stage we built 300 psi of pressure. Once we caught the cement the pressure was at 160 psi at 4 bpm and ended at 460 psi @ 4 bpm prior to bumping the plug. If we had tail cement 14.6 ppg from the shoe to the DV tool we would have built 268 psi (difference vs 8.3 ppg displacement fluid). Since we built more than that we have cement very high in that section. We calculate TOC on the 1st stage is at the DV tool (2779').

$$(3598' - 2779') \times 0.052 \times (14.6 \text{ ppg} - 8.3 \text{ ppg}) = 268 \text{ psi}$$
