NATURE OF RELEASE											
Type of Release - Condensate Volume of Release - 6 BBL Volume Recovered - none											
	Source of Release: Hole in condensate tank									e and Hour of Discovery	
							Prior to 3/20/07 3/20/07 - 11:30 p.m. If YES, To Whom?				
Was Immediate Notice Given?						If YES, To Whom?					
✓ Yes ☐ No ☐ Not Required						Brandon Powell – OCD – via email OIL CONS. DIV.					
By Whom? Monica D. Johnson						Date and Hour - 3/21/07 - 4:30 p.m. DIST. 3					
Was a Watercourse Reached?  ☐ Yes ☒ No						If YES, Volume Impacting the Watercourse.					
If a Watercourse was Impacted, Describe Fully.*											
Describe Cause of Problem and Remedial Action Taken.* A condensate spill of an estimated 6 BBL was discovered at the Cuccia											
Com B #4 on 3/20/07, due to a hole in the bottom of the 210 BBL condensate tank that appears to have been leaking											
for quite awhile. Upon investigation of the source of the leak, a piece of the tank flaked off, indicating corrosion. It is											
assumed that the hole may be in the center of the bottom of the tank, due to how long it took to surface at the side of											
the tank. All spilled fluids remained within the bermed area. The contents of the tank will be pulled on 3/21/07, a One-											
Call has been placed, and a crew will be removing the tank by 3/26/07, with excavation to investigate the extent of the											
spill to follow. Depending on what is found in the investigation, the spill volume may be revised on the final report.											
Describe Area Affected and Cleanup Action Taken.* All spilled fluids remained within the bermed area. The impacted soils will											
be excavated and either landfarmed on site if space allows or hauled offsite to a commercial landfarm, with the											
excavated area being backfilled with clean fill dirt. Excavation will continue until it is determined that a five-point											
composite soil sample of the four sides and the bottom of the excavation has a TPH level of ≤5,000 ppm and a total BTEX level of ≤50 ppm, or to the maximum depth and horizontal extent practicable. (A field soil vapor headspace											
measurement of 100 ppm may be substituted for the BTEX analysis.) Final lab analysis results will be included in the											
final report following remediation activities.											
I hereby certify that the information given above is true and complete to the best of my knowledge and understand that pursuant to NMOCD rules and											
regulations all operators are required to report and/or file certain release notifications and perform corrective actions for releases which may endanger											
public health or the environment. The acceptance of a C-141 report by the NMOCD marked as "Final Report" does not relieve the operator of liability											
should their operations have failed to adequately investigate and remediate contamination that pose a threat to ground water, surface water, human health or the environment. In addition, NMOCD acceptance of a C-141 report does not relieve the operator of responsibility for compliance with any other											
federal, state, or local laws and/or regulations.
