

March 18, 1973

Dear Friends:

Letter #2
Guess you have been wondering what happened to me or the well in N. Mex. I haven't had much to write about it now. Actually we never got the snow frac. the upper pay zone which was one with 22 ft of saturation, both oil and gas. The engineers of Halliburton wanted to go down to the picture cliffs which is at 2980 and frac. There first which we did but our production hasn't in the picture cliffs but the oil almost zone is a little more than two hundred, higher. The well is still open and is a completed with tubing etc., actually on geologists' advises. So to keep the well open and move over a few feet to the north and drill another well and carry it all the way from 2200 ft which is a good thing and we can pick up the oil almost zone which is approx. at 2580. As you know we got a good well as an unusual amount of show before even fracturing, so it might be the 2580 zone would only need a light frac, but as you know one can't

produce the gas would need to produce
another well if we get the oil,
the first one. On sending the Schme
wells which are to the north of
well about $\frac{3}{4}$ of a mile from the
well we drilled and as you can see
they got their best (or the be
we've produced from the oil Alimo.
Which came in about 2563 -
and is one of the best producing ga
wells in the nation, it has produc
more than a million cubic feet a
for the past 19 years and still go
we are running a few feet higher
elevation so there's no doubt our
will come in at approximately
2580. For then of the fact the Gas
investors help approve this area &
won't to give them first chance
this second well also, actually it
will be buying in on something it
have already approved as you know
gas covers more than a 160 acre
site & this new Greathouse No II is
will be in the middle of the
already discovered zone.

Greathouse you are now
as on the first. We have set up a
drilling intention for April 15, but
will need to know their decision
soon as possible. There are others
that want in but I don't think
would be fair to any of us to take
in some one new on something to
is a sure thing. Actually we could go
until the oil or gas 'gave out on
the first well and then produce
other but that might take you
and by drilling two wells we can
realize our investment from both
wells. Since our geologists have
advised us on this we have got
a block of land in that area
hope to drill 20 wells this spring
we have a very nice Franks
diesel rig now, big diesel truck
hauling so we're just waiting on the
weather to break. Please advise
others as to our intentions. Enclosure
also are two reports of recent wells
that have been brought in to the
of our location, these are good prod
gas wells. Write soon. Sincerely
Juanita Marks
