- A packer leakage test shall be commenced on each multiply completed within seven days after actual completion of the well, and annually eafter as prescribed by the order authorizing the multiple completion. tests shall also be commenced on all multiple completions within n days following recompletion and/or chemical or fracture treatment, whenever remedial work has been done on a well during which the packer he tubing have been disturbed. Tests shall also be taken at any time communication is suspected or when requested by the Commission.

- The packer leakage test shall commence when both zones of the dual apletion are shut-in for pressure stabilization. Both zones shall rein shut-in until the well-head pressure in each has stabilized, provided wever, that they need not remain shut-in more than seven days.

 For Flow Test No. 1, one zone of the dual completion shall be produced the normal rate of production while the other zone remains shut-in. the test shall be continued for seven days in the case of a gas well and r 24 hours in the case of an oil well. Note: If, on an initial packer a pipeline connection the flow period shall be three hours.

 This graph completion of Flow Test No. 1 the stable back has a stable and the stable be the shull content to the atmosphere due to the lack a pipeline connection the flow period shall be three hours.
- Flow Test No. 2 shall be conducted even though no leak was indicating Flow Test No. 1. Procedure for Flow Test No. 2 is to be the second Flow Test No. 1 except that the previously produced zone shall a shut-in while the zone which was previously shut-in is produced.

- 7. Pressures for gas-zone tests must be measured on each zone with a deadweight pressure gauge at time intervals as follows: 3-hour tests: immediately prior to the beginning of each flow-period, at fifteen-minutintervals during the first hour thereof, and at hourly intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period. 7-day tests: immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, o may be requested on wells which have previously shown questionable test data.
- 24-hour oil zone tests; all pressures, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges, the accuracy of which must be checked at least twice, once at the beginning and once at the end of each test, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil zone only, with deadweight pressures as required above being taken on the gas zone.

 8. The results of the above-described tests shall be filed in triplicate within 15 days after completion of the test. Tests shall be filed with the Aztec District Office of the New Mexico Oil Conservation Commission on Northwest New Mexico Packer Leakage Test Form Revised 11-1-58, with all deadweight pressures indicated thereon as well as the flowing temperatures (gas zones only) and gravity and GOR (oil zones only). A pressure versus time curve for each zone of each test shall be constructed on the reverse side of the Packer Leakage Test Form with all deadweight pressure points taken indicated thereon. For oil zones, the pressure curve should also indicate all key pressure changes which may be reflected by the recording gauge charts. These key pressure changes should also be tabulated on the front of the Packer Leakage Test Form.

Pressure (Hundreds of Pounds)
