Re: Continental Oil Company  
AXI Apache J #12, K-5-25N-5W

Dear Mr. Haley:

The initial potential test for each zone shows 915 PSI as reported September 28, 1966, on form 9-331.

The packer-leakage test submitted January 10, 1967 indicated a shut-in pressure of 935 PSI for each zone.

The occurrence of identical pressures is rare for one test and extremely rare for two consecutive tests for a multiple completion well.

Please cause the well to be scheduled for a packer test (Chacra flow) as soon as is practical.

Yours very truly,

A. R. Kendrick  
Engineer, District #3
