# NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

1 A packer leakage test shall be commenced on each multiply completed well within seven days after actual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all multiple completions within seven days following recompletion and/or chemical or fracruse treatment, and whenever remedial work has been done on a well during which the packer or the tubing have been disturbed. Term shall also be taken at any time that communication is suspected or when requested by the Division

Commenced at (hour, date) 半本

LAPSED TIME

SINCE ##

TIME

fhour, date)

- At least 72 hours prior to the commencement of any packer leakage test, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offset
- 3. The packer leakage test shall commence when both zones of the dual completion are shut-to for pressure trabilization. Both zones shall remain shut-in until the well-head pressure in each has stabilised, provided however, that they need not remain shut-in more
- 6. For Flow Test No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains shut-in. Such test shall be continued for seven days in the case of a gas well and for 24 hours in the case of an oil well. Note: if, on in initial packer leakage test, a gas well is being flowed to the atmosphere due to the lack if a pipeline connection the flow period shall be three hours.
- ). Following completion of Flow Test No. 1, the well shall again be shur-in, in accor-
- i. Flow Test No. 2 shall be conducted even though no leak was indicated during Flow Test No. 1 Procedure for Flow Test No. 2 is to be the same as for Flow Test No. 1 excep

- that the previously produced some shall remain shut in while the zone which was previously shut-in is produced.
- 7. Pressures for gas-zone sens must be measured on each zone with a deadweight pressure gauge at time intervals as follows: 3 hours terms: immediately prior to the beginning of each flow-period, at lifteen-minute intervals during the first hout thereof, and at bourly intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period. 7-day tests: immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the coordination of each flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shown ques-

34-hour oil zone tests: all pressures, throughout the entire test, shall be continuously sured and recorded with recording pressure gauges the accuracy of which must be checked at least twice, once at the beginning and once at the end of each test, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil zone only, with deadweight pressures as required above being taken on the gas zone.

8. The results of the abow:-described ocus shall be filed in triplicate within 13 days after completion of the test. Tests shall be filed with the Astec District Office of the New Mexico Oil Conservation Division on Northwest New Mexico Packer Leakage Test Form Revised 10-01-78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas sones only) and gravity and GOR (oil sones only).
