## NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A packet leakage test shall be commenced on each multiply completed well within seven days after actual completion of the well, and annually thereafter as prescribed by the order nuthorizing the multiple completion. Such tests shall also be commenced on all multiple completions within seven days following recompletion and/or chemical or fracture treatment, and whenever remedial work has been done on a well during which the packet or the tubing have been disturbed. Tests shall also be taken at any time that communication Is suspected or when requested by the Division.
- 2. At least 72 hours prior to the commencement of any packer leakage test, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.
- 3. The packer leakage test shall commence when both zones of the dual completion are that in for pressure trabilization. Both zones shall tentain thur in until the well-head pressure in each has trabilized, provided however, that they need not remain that in more than seven days.
- 4. For Flow Test No. 1, one ibne of the dual completion shall be produced at the normal rate of production while the other zone remains shut-in. Such test shall be continued for seven days in the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage test, a gas well in being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall be three hours.
- 5. Following completion of Now Ten No. 1, the well thall again be shut-in, In accordance with Paragraph 3 above.
- 6. How Ten'No. 1 shall be conducted even though no test was indicated during Flow Ten No. 1. Procedure for flow Ten Ho. 2 into be the same as for flow Ten No. 1 except

- that the previously produced zone shall remain shut in while the zone which was previously shut in it produced.
- 7. Pressures for gat-zone tests must be meanifed on each zone with a deadweight pressure gauge at time intervals at follows: 3 hours tests: immediately prior to the beginning of each flow-period, at fifteen-minute intervals during the first hour thereof, and at hously intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period. 7-day tests immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken at desired, or may be requested on wells which have previously thown questionable test data.
- 24-hour oil zone tetti: all pressures, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be checked at least swice, once at the beginning and once at the end of each test, with a deadweight pressure gauge, If a well it a gas-oil or an oil-gas shall completion, the recording gauge shall be required on the oil zone only, with deadweight pressures at required above being taken on the gas zone.
- 8. The results of the above-described tent shall be filed in triplicate within 13 days after completion of the tent. Tent shall be filed with the Azice District Office of the New Hesico Oil Conservation Division on Northwest New Mexico Packer Leakage Test Form Revised 10 01-78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas zones only) and gravity and GOR foil sones only).
