DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudding jobs, cementing points, and all other important proposed work)

The Federal 11-11 #1 was spudded on February 1, 1959. A 12 1/4" hole was drilled to 320', and 8-5/8" casing was set at that point with 275 sx neat cement. Cement was circulated to surface. After 2 1/2 hours the pipe was tested with 1000 psi water pressure and found to have no leaks. A 7-7/8" hole was then drilled to a TD of 5575'. 5 1/2" casing was set at that point with 300 sx neat cement. After 30 hours the casing was tested with 1500 psi water pressure, and was found to have no leaks. PBTD is 5520'. The casing was perforated from 5470'-5484' and 5501'-5513' with two jet shots per foot. The well was then fraced with 30,000 gal lease crude and 105,000 lb sand. Sand fillup was cleaned out and the well was placed on production. Presently, the load oil is being recovered. Drilling was completed on February 16, 1959.

I understand that the plan shown on this form has been approved in writing by the Geological Survey before operations may be commenced.
