NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

Date //-30.96

A packer leavage test analis be commenced on each multiply completed well within seven days after actual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shar line be connected on all multiple completions within seven days following recormiction and/or chemicar or fracture treatment, and whenever remedial work has been done on a well dust $|z|w_{\rm s}/\hbar$ the packer or the tubing have been disturbed. Tests shall also be taken at any time that or unication is suspected or when requeste: the Division.

Title

 $\Lambda_{\rm C}$ rast 72 hours prior to the commenceme -10 any packer leakage test, the operator shall notify the vision in writing of the exact time the test is ω on commenced. Offset operators shall also be so

The packer leakare at shall commence when both zones of the dual completion are shat-in for ressure stabilization. outn 2. coes shall remain shut-in until the well-head pressure in each has stabilized, provided however, that they need not remain shut-in more than seven days.

- 4. For flow Test No. 1, one zone of the dual commetion shall be produced at the normal rate of production while the otors come remains shut-in such test shall be continued for seven days if the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage test, a gas well is being a wed to the atmosphere due to the lack of a pipeline connection the flow period shall be three hours.
- 5. Following completion of flow Test No. 1, the well shall again be shat-in, in accordance with
- 6. Flow Test No. 2 shall be conducted even though no leak was indicated during flow Test No. 1. Procedure for Flow Test No. 2 is to be the same as for Flow Test No. 1

- except that the previously produced zone shall remain shat-in while the zone which was previously shut-in is produced.
- 7. Pressures for gas-zone tests must be measured on each zone with a des pressure gauge at time intervals as follows: 3 hours tests: immediately pr - a the beginning of each flow-period, at fifteen minute intervals during the Amour thereof, and at hourly intervals thereafter, including one pressure measurement immediately prior to the flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shown questionable test data.

24-hour oil zone tests: all pressures, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be checked at least twice, once at the beginning and once at the end of cam test, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil zone only, with deadweight pressures as required above being taken on the gaz zone.

8. The results of the above described tests shall be filed in triplicate within 15 days after completion of the test. Tests shall be filed with the Aztec District Office of the New Mexico Oil Conservation Division of Northwest New Mexico Packer Leakage Test form Revise: 10/01/78 with all deadweight pressures indicated thereon 2: as the flowing temperatures (gas zones only) and gravity and GOR (of
