Figure 1. A schematic diagram of the experimental design. The subjects were divided into two groups: the control group and the experimental group. The control group received a standard training program, while the experimental group received a modified training program. The subjects were then tested on a series of tasks, and their performance was compared between the two groups.

Figure 1 is a line graph with the x-axis labeled 'Number of hauls' ranging from 1 to 10, and the y-axis labeled 'Percentage of total catch' ranging from 0 to 100. There are two data series: a solid line representing *P. setiferus* and a dashed line representing *P. setiferus* + *P. setiferus* + *P. setiferus*. The solid line starts at approximately 10% for 1 haul, rises to about 30% for 2 hauls, 60% for 3 hauls, 80% for 4 hauls, and reaches nearly 100% by the 10th haul. The dashed line starts at approximately 10% for 1 haul, rises to about 15% for 2 hauls, 18% for 3 hauls, 20% for 4 hauls, and reaches approximately 20% by the 10th haul.
