### NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

1. A packer leakage ten shall be commenced on each multiply completed well within seven dava after actual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such terms shall also be commenced on all multiple completions within seven days following recompletion and for chemical or fracture treatment, and whenever remedial work has been done on a well during which the packet or the tubing have been disturbed. Tests shall also be taken at any time that communication is suspected or when requented by the Division.

Commenced at thour, date! \* \*

- 2. At least 72 hours prior to the commencement of any parker leakage test, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.
- 3. The packer leakage test shall commence when both zones of the dual completion are shut-in for pressure mabilization. Both zones shall remain shut-in until the well-head pressure in each has mabilized, provided however, that they need not remain shut-in more than seven days.
- 4. For Flow Text No. 1, one zone of the dual completion shall be produced as the normal rate of production while the other zone remains shut-in. Such text shall be continued for seven days in the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packet leakage text, a gas well is being flowed to the aumosphere due to the lack of a pipeline connection the flow period shall be three hours.
- 5. Tolliming completion of flow Test No. 1, the well shall again be shut-in, in accordance with Paragraph 3 above.
- 6. Fire Tent'No. 2 shall be conducted even though no leak was indicated during Now-Tent No. 1. Freeedute for Fire Tent No. 2 is to be the same as for Flow Tent No. 1. Freept

- that the previously produced zone shall ternain shut in while the zone which was previously shut in is produced.
- 7. Pressures for gas-zone tests must be measured on each zone with a deadweight pressure gauge at time intervals as follows: 3 hours tests: immediately prior to the beginning of each flow-period, at fifteen-minute intervals during the fust hour thereof, and as hourly intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period. 7-das tests: immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shown questionable test data.
- 24-hour oil some texts: all pressures, throughout the entire text, shall be continuously measured and seconded with recording pressure gauges the accuracy of which must be checked at least twice, once at the beginning and once at the end of each text, with a deadweight pressure gauge. If a well is a gas-oil of an oil-gas dual completion, the recording gauge shall be required on the oil zone only, with deadweight pressures as required above being taken on the gas sone.
- 8. The results of the above-described tests shall be filed in triplicate within 1) days after completion of the test. Tests shall be filed with the Aster District Office of the New Mexico Oil Conservation Division on Northwest New Mexico Packer Leakage Test Issum Revised 10-01-78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas zones only) and gravity and GOR (oil zones only).
