NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A packet leakage test shall be commenced on each multiply completed well within seven days after actual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all multiple completions within seven days following recompletion and/or chemical or fraction contents, and whenever remedial work has been done on a well during which the packet or the tubing have been disturbed. Tests shall also be taken at any time that communication is suspected or when requested by the Division.
- 2. At least 72 hours prior to the commencement of any packet leakage test, the operator shall notify the Divition in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.
- 3. The packer leakage test shall commence when both anner of the dual completion are thur-in for pressure stabilization. Both anner shall remain abut-in until the well-head pressure in each has trabilized, provided however, that they need not remain shut-in more than seven days.
- 4. For Now Yest No. 1, one tone of the dual completion thall be produced at the normal rate of production while the other zone remains shut in, Such test shall be continued for seven days in the case of a par well and for 24 hours in the case of an oil well. Plutes if, on an initial packet leakage test, a gas well in being flowed to the asmosphere due to the lack of a pipeline connection the flow period thall he three hours.
- 3. Following completion of flow Ten blo, I, the well thall again be shot in, in accordance with Paragraph 3 above,
- 6. How Test'bla, I shall be conducted even though no lebk was indicated during flow Test No. 1. Procedure for flow Test blo, I is to be the same as for flow Test No. 1 except

- that the previously produced zone shall temalo shut-lo while the zone which was previously shut-io is produced.
- 7. President for par-zone term must be measured on each zone with a deadweight president gauge at time intervals at follows: 3 hours term; inductively prior to the beginning of each flow-period, at fifteen-minute intervals during the first hour thereof, and at hourly intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period. 7-day term; immediately prior to the beginning of each flow period, as least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, of may be requested on wells which have previously shown questionable tert data.

24-hour oil zone rests: all pressures, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be checked at least twice, once at the beginning and once at the end of each test, with a deadweight pressure gauge. If a well is a gar-oil or an oil-gas dual completion, the recording gauge shall be required on the oil aone only, with deadweight pressures as required above being taken on the gas zone.

8. The results of the above described term shall be filed in triplicate widdin 13 days after completion of the term. Term shall be filed with the Astee District Office of the Her Herico Oil Conservation District on Houstweet Hew Mexico Packer Lesbage Tert Form Revised 10-01-28 with all deadweight pressures Indicated thereon as well as the flowing temperatures (gas zones only) and gravity and GOR foil zones only).
