NORTHWEST NEW MEDICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A packet leskage test shall be commenced on each multiply completed well within seven days after acrual completion of the well, and annually thereafter as presented by the order authorizing the multiple completion. Such term shall also be commenced on all multiple completions within seven days following recompletion and/or chemical or fracrure treatment, and whenever remedial work has been done on a well during which the packer or the tubing have been distruibed. Term shall also be taken at any time that communication is superred or when requested by the Division.
- At least 72 hours prior to the commencement of any packer leakage test, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.
- 3. The packet leakage test shall commence when both zones of the dual completion are shut in for pressure stabilization. Both zones shall remain shut in until the well-head pressure in each has stabilised, provided however, that they need not remain short-in more then seven days.
- 4. For Flow Test No. 1, one lone of the dual completion shall be produced at the normal rate of production while the other zone remains shut in. Such test shall be continued for seven days in the case of a gra well and for 24 hours in the case of an oil well. Note: if, on an initial packet leakage test, a gra well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall be three hours.
- 3. Following completion of Flow Test No. 1, the well shall again be shut-in, in acrosdance with Paragraph 3 above.
- 6. Flow Test'No. 2 shall be conducted even though no leak was indicated during Flow Test No. 1. Procedure for Flow Test No. 2 is to be the same as for Flow Test No. 1 except

- that the previously produced soos shall remain shur-in while the soos which was previousby shur in is produced.
- 7. Pressures for gui-zone term must be measured on each zone with a deadweight pressure gauge at time intervals as follows: I hours term: immediately prior to the beginning of each flow-period, at fifteen-minute interrals during the first hour thereof, and at bourly intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period. 7-day resu: immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the coochision of each flow period. Other pressures may be taken so desired, or may be requerted on wells which have previously shown questionable test data.

24-hour oil zone tesu: all pressures, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges the securacy of which must be checked at least twice, once at the beginning and once at the end of each tert, with a desdweight pressure gauge. If a well is a gast-oil or an oil-gas dual completion, the recording gauge shall be required on the oil took only, with deadweight pressures as required above being taken on the gas soot.

8. The results of the above-described term shall be filed in triplicate within 13 days after completion of the tent. Term shall be filed with the Aster District Office of the New Mexico Oil Conservation Division on Northwest New Mexico Packer Leakage Test Form Revised 10-01-78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gra 2000s early) and gravity and GOR (oil zones only).
