### NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A packer leakage test shall be commenced on each multiply completed well within seven days after actual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all multiple completions within seven days following recompletion and/or themical or fracture unauthorizing which is even days following tecompletion and/or themical or fracture unauthorized whenever remedial work has been done on a well during which the patter or the tubing have been durimbed. Tests shall also be taken at any time that communication is suspected or when requested by the Division.
- 2. At least 72 hours prior to the commencenient of any packer leakage test, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offset operator shall also be so notified.
- 3. The packer leakage ten studi commence when both zones of the deal completion are shown for pressure mabilization. Both zones shall remain shout in until the well-head pressure in each has stabilized, provided however, that they need not remain shout in more than seven days.
- 4. For Flow Ten No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other sone remains shut-in. Such ten shall be continued for seven days in the case of a par well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage tent, a par well is being flowed to the authorphete due to the lack of a pipeline connection the flow period shall be three hours.
- 3. Following completion of Flow Test No. 1, the well shall again be shut-in, in accordance with Paragraph 3 shows.
- C. Fire Ten No. 2 shall be conducted even though no leak was indicated during Flow Ten Lo. 1. So with a few Fire Tou No. 2 o to be the same as for I see Ten No. 1 except

that the previously produced zone shall remain shut-in while the zone which was prely shut-in is produced.

i'n.

7. Pressures for gas-zone teru must be measured on each zone with a deads pressure gauge at time intervals at follows; 3 hours terus immediately prior to the leting of each flow-period, at fifteen-minute intervals during the first how thereof, a hourly intervals discreafier, including one pressure measurement immediately prior conclusion of each flow period. 7-day terus immediately prior to the beginning of flow period, at least one time during each flow period (at approximately the mipoint) and immediately prior to the conclusion of each flow period. Other pressure be taken as desired, or may be requested on wells which have previously shown tionable teru data.

24-hour oil sont tent: all pressures, throughout the entire tent shall be continued and recorded with recording pressure gauges the accuracy of which machecked at lean twice, once at the beginning and once at the end of each tent, deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the ring gauge shall be required on the oil sone only, with deadweight pressure as resulting gauge shall be required on the oil sone only, with deadweight pressure as re-

8. The result of the above-described term shall be filed in triplicate within 15 day completion of the term. Term shall be filed with the Azere Dursiet Office of the New 1 Oil Conversation Division on Northwest New Mexico Facker Leakage Tert Form 5 10-01-78 with all desdweight pressures indicated thereon as well as the facing term (gas some only) and gravity and GOR (oil zones only).
