NORTHWEST NEW MEDICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A packer leakage test shall be commenced on each multiply completed well within some days after actual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all multiple completions within seven days following recompletion and/or chemical or fracture treatment, and whenever remedial work has been done on a well during which the parker or the tubing have been durrunted. Tests shall also be taken at any time that communication is suspected or when requested by the Division.
- 1. At least 72 hours prior to the commencement of any pather leakage test, the operator all notify the Division in writing of the exact time the test is to be commenced. Offset person shall also be so notified.
- The packer leakage test shall commence when both zones of the dual completion are shall remain shut-in until the well-head pressure in each has stabilized, provided however, that they need not remain shut-in more than seven days.
- 4. For Flow Ten No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains shut-in. Such ten shall be continued for seven days in the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage ten, a gas well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall be three hours.
- 5. Following completion of Flow Test No. 1, the well shall again be shut-in, in accordance with Paragraph 3 above.
- Flow Tent'No. 2 shall be conducted even though no leak was indicated during Flow.
 Test No. 1. Procedure for Flow Tent No. 2 is to be the same as for Flow Tent No. 1 except

- that the previously produced zone shall remain shut-in while the zone which was previously shut-in is produced.
- 7. Pressures for gas-zone term must be measured on each zone with a deadweight pressure gauge at time intervals as follows: 3 hours term: immediately prior to the beginning of each flow-period, at fateen-minute intervals during the first hour thereof, and at hourly intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period. 7-day term: immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures read be taken as desired, or may be requested on wells which have previously shown quintonable test data.

24-hour oil zone tests, all pressures, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be checked at least twice, once at the beginning and once at the end of each test, with deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil zone only, with deadweight pressures as required above being taken on the gas zone.

8. The results of the above-described term shall be filed in triplicate within 1) days after completion of the test. Term shall be filed with the Arter District Office of the New Mexico Oil Conservation Division on Northwest New Mexico Packer Leakage Test Form Review 10-01-78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas aones only) and gravity and GOR (oil sones only).
