The elevation of the Ground ~~derrick floor~~ above sea level is 6690 ft.

DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mud logging jobs, cementing points, and all other important proposed work)

We propose to drill this well with rotary tools to a sufficient depth to test the Gallup Sand expected at 3500'. We propose to set 350' of 8 5/8" surface casing and cement to surface; to drill through the Gallup Sand section to a depth of approximately 3500' and if, upon evaluation of open hole information & electrical surveys, there is indication of commercial production, to run 5 1/2" casing with sufficient cementing to bring top of cas. at least 300' above top of test zone or 600' above cas. shoe, whichever is the higher.

We propose to gun perforate the casing and, if necessary, to sand-oil fracture during completion.

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.
