NORTHWIEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A packer leakage test shall be commenced on each multiply completed well within seven days after actual completion of the well, sell annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all multiple completions within even days fell-living recompletion and/or chemical or fracture treatment, and wherever remelial work has been done on a well during which the packer or the tubing have been distribed. Tests shall also be taken at any time that communication is suspected or when requested by the Division.
- 2. At least 72 hours prior to the commencement of any packer leakage test, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.
- 3. The packer leakage test shall commence when both zones of tije dual completion are shuf-in for pressure stabilization. Both zones shall remain shuf-in until the well-head pressure in each has stabilized, provided however, that they need not remain shuf-in more than seven days.
- 4. For Flow Test No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains shipt-in. Such test shall be continued for seven days in the case of a gas well and for 24 heurs in the case of an oil well. Note: if, on an initial
- packer leakage test, a gas well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall be three hours.
- Following completion of Flow Test No. 1, the well shall again be shul-in, in accordance with Paragraph 3 above.
- 6. Flow Test No. 2 shall be conducted even though no leek was indicated during Flow Test No. 1. Procedure for Flow Test no. 2 is to be the same as for Flow Test No. 1 except

- that the **previously** produced zone shall remain shut-in while the zone which was previously shut-in is produced.
- 7. Pressures for gas-zone tests must be measured on each zone with a deadweight pressure gauge at time intervals as follows: 3 hours tests: immediately prior to the beginning of each flow-period, at fifteen-minute intervals during the first hour thereof, and at houtly intervals thereafter, including one pressure measurement immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shown questionable test date.
- 24-hour oil zone tests: all pressures, throughout the entire test, shall be continuouilly measured and recorded with recording pressure gauges the accuracy of which night be checked at least twice, once at the beginning and once at the end of each left, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual contelletion, the recording gauge shall be required on the oil zone only, with deadweight pressures as required above being taken on the gas zone.
- 8. The regists of the above-described tests shall be filed in triplicate within 15 days after complition of the test. Tests shall be filed with the Azlec District Office of the New Mexico oil Conservation Division on northwest new Mexico packer leakage Test Form Revised 11-16-98 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas zones only) and gravity and GOR (oil zones only).
