NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

1. A packer leakage test shall be commenced on each multiply completed well within seven days after actual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all multiple completions within seven days following recompletion and/or chemical or fracture treatment, and whenever temedial work has been done on a well during which the packer or the tubing have been directled. Tests shall also be taken at any time that communication is suspected or when requested by the Division.

LAPSED TIME

SINCE # #

- 2. At least 72 limits prior to the commencement of any packer leakage test, the operator shall muify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.
- 3. The parker leakage test shall commence when both zones of the dual completion are shut in for pressure stabilization. Both zones shall remain shut in until the well-head pressure in each has trabilized, provided however, that they need not remain shut in more than seven days.
- 4. For the Text No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains shut-in. Such test shall be continued for seven dast in the raw of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial garber trakage test, a gas well in being flowed to the autoophere due to the lack of a pipeline connection the flow period shall be three hours.
- 3. Inflicing complesion of flow Text No. 1, the well shall again be shut-in, so accordance with Paragraph 3 above.
- 6 Flow Tent'No. 2 shall be conducted even shough on leab was indicated during flow

- that the previously produced zone shall remain shut in while the zone which was previously shut in is produced.
- 7. Presentes for gas-zone term must be measured on each zone with a deadweight pressure gauge at time intervals as follows: 3 hours tests: immediately prior to the beginning of each flow-period, at fifteen-minute intervals during the first hour thereof, and at hourly intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period, 7-das term: immediately prior to the beginning of each flow-period, at least one time during each flow-period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shown questionable test data.
- 24 hour oil anne teru: all pressures, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be checked at least swice, once as the beginning and once as the end of each test, with a deadweight pressure gauge. If a well it a gas oil of an oil-gas dual completion, the recording gauge shall be required on the oil anne only, with deadweight pressures as required above being taken on the gas some.
- B. The results of the above described tests shall be filed in triplicate within 13 days after completion of the test. Tests shall be filed with the Atter District Office of the New Meuro Oil Conservation Division on Northwest New Meuro Packet Leshage Test Isom Revised 10.01-78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas sones only) and gravity and GOR (oil sones only).
