## NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A packer leakage test shall be commenced on each multiply completed well within seven days after actual completion of the well, and annually disrentiate apprescribed by the order authorising the multiple completion. Such tests shall also be commenced on all multiple completions within seven days following recompletions and loncheroical or fracture treasment, and whenever remedial work has been done on a well during which the packer or the subing have been disrurbed. Tests shall also be taken at any singe that communication is suspected or when requested by the Division.
- 2. At least 72 hours prior to the commencement of any packer lealinge pest, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.
- 3. The packer linkage test shall committee when both zones of the dual completion are shur-in for pressure stabilization. Both zones shall remain shur-in until the well-head pressure in each has stabilized, provided however, that they med not remain shur-in more than seven days.
- 4. For Flow Test No. 1, one zone of the dual completion shall be produced as the normal rate of production while the other zone remains shut-ini, Such test shall be captioused for seven days in the cast of a gas well and for 24 hours in the cast of an oil well. Note: if, on an initial packer lealings test, a gas well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall be three hours.
- 5. Following completion of Flow Test No. 1, the well shall again be shut-in, in accordance with Paragraph 3 above.
- 6 . T. . Test'No. I shall be eftend erret even . . . . no leak was indiffaced durine Flow

- that the previously preduced zone shall remain shur-in while the zone which was previously shur-in is produced.
- 7. Pressures for gas-some tests must be measured on each zone with a deadweight pressure gauge at time intervals as follows: 3 hours tests: immediately prior to the beginning of each flow-period, at fifteen-minute intervals during the first hour thereof, and at hourly intervals thereuser, including one pressure measurement immediately prior to the conclusion of each flow period. 7-day tests: immediately prior to the beginning of each flow period, at least sine time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, a may be requested on wells which have previously shown questionable test data.

24-hour oil zone mists: all pressures, throughout the entire test, shall be continuously measured and recording with recording pressure gauges the accuracy of which must be checked at least twice, once at the beginning and once at the end of each test, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil zone only, with deadweight pressures as required above being taken on the gas zone.

8. The results of the above-described tests shall be filed in triplicate within 15 days after completion of the test. Tests shall be filed with the Aztec District Office of the New Mexico Oil Conservation Division on Northwest New Mexico Packer Leakage Test Form Revised 10-01-78 with all desdweight pressures indicated thereon as well as the flowing temperatures (gas zooms only) and gravity and GOP roil zones only).
