NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A packer leakage test shall be commenced on each multiply completed well within seven days after actual completion of the well, and annually thereafter as passwised by the order authorizing the multiple completion. Such tests shall also be connected on all multiple completions within seven days following recompletion and/or chemical or fracture treatment, and whenever streadid work has been done on a well pressure gauge at these intervals as follows: 3 hours tests: immediately prior to the during which the packer or the tubing have been disturbed. Tests shall also be taken at any time that amication is suspected or whon requested by the Division.
- 2. At least 72 hours prior to the commencement of any packer leakage test, the operator shall notify the Division in writing of the exact time the test is to be assumenced. Offset operators shall also be so notified.
- 3. The protect leakage test shall commence when both some of the dual completion are shat-in for pressure stabilization. both zones shall remain shus-in until the well-head secesure in each has stabilized, ovided however, that they need not remain shut-in more than seven days
- 4. For flow Test No. 1, one zone of the duni completion shall be preclused at the normal rate of production while the other zone remains shat-in. Such test shall be quatiraged for seven days if the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage test, a gas well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall be
- 5. Following completion of flow Test No. 1, the well shall again be shut-in, in accordance with Paragraph 3 show
- 6. Flow Test No. 2 shall be conducted even though no leak was indigated during flow Test No. 1. Procedure for Flow Test No. 2 is to be the same as for Flow Test No. 1

- except that the penetionally produced zone shall remain shat-in while the zone which
- 7. Pressures for gas-some tests must be measured on each zone with a deadweight beginning of each flow-period, at fifteen minute intervals during the first hour thereof, and at hearly intervals thereafter, including one pressure measurem immediately prior to the flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shown questionable test data.
- 24-hour oil zone tiest: all pressures, throughout the entire test, shall be continuously menimized and recorded with recording pressure gauges the accuracy of which must be changed at least twice, once at the beginning and once at the end of cach test, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the restording gauge shall be required on the oil zone only, with deadweight pressure as required above being taken on the gaz zone.
- 8. The results of the above described tests shall be filed in triplicate within 15 days after completion of the test. Tests shall be filed with the Aztec District Office of the New Mexico Oil Conservation Division of Northwest New Mexico Packer Lealings Test form Revised 10/01/78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas zones only) and gravity and GOR (oil zones only).
