NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A packer leakage test shall be commenced on each multiply completed well with seven days after actual completion of the well, and anoually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all multiple completions within seven days following recompletion and/or chemical or fraccure treatment, and whenever remedial work has been done on a well during which the packer or the rubing have been disturbed. Tests shall also be taken at any time that communication is suspected or when requested by the Division.
- At least 72 hours prior to the commencement of any packer leakage test, the operator shall notify the Division in writing of the exact time the sext is so be commenced. Offset operators shall also be so notified.
- 5. The packer leakage test shall commence when both zones of the deal completion are shut-in for pressure stabilization. Both zones shall remain shut-in until the well-head pressure in each has stabilized, provided however, that they need not remain shut-in more. then seven days.
- 4. For Flow Test No. 1, one some of the dual completion shall be produced at the normal race of production while the other some remains shus-in. Such test shall be continued for seven days in the case of a gas well and for 14 hours in the case of an oil well. Note: if, on an initial packer leakage test, a gas well is being flowed to the samesphere due to the lack of a pipeline connection the flow period shall be three hours.
- 5. Following completion of Flow Test No. 1, the well shall again be shot-in, in accordeace with Paragraph 3 above.
- 6. How Test'No. I shall be conducted even shough no look was indicated during Flow Test No. 1. Procedure for Flow Test No. 2 is to be the mote to for Flow Test No. 1 emerge

- that the previously produced zone shall remain shor-in while the zone which was previously short-in is produced.
- 7. Pressures for gas-some tests must be measured on each some with a deadweight pressure gauge at time intervals as follows: 3 hours tests: immediately prior to the beginning of each flow-period, at lifteen-minute intervals during the list hour thereof, and at hourly intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period. 7-day terms: immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midway point) and intracdimely prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shown quescionable test data.

24-hour oil zone sexe: all pressures, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be checked at least roice, once at the beginning and once at the end of each test, with a dendweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil zone only, with deadweight pressures as required shove being taken on the gas some.

8. The results of the above-described tests shall be filed in triplicate within 19 days after completion of the rest. Tests shall be filed with the Asset District Office of the New Mesuro Oil Conservation Division on Northwest New Mesico Pacher Leskage Test Form Revised 10-01-78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas somes only) and gravity and GOR (oil somes only).
