THE TREATMENT OF THE ACUTE INFLUENZA

BY DR. J. H. HAY, CHICAGO, ILL.

THE ACUTE INFLUENZA is a disease of the respiratory tract, and its treatment should be directed toward the relief of the symptoms and the prevention of complications.

The first step in the treatment of the acute influenza is the relief of the fever. This can be accomplished by the use of antipyretics, such as acetaminophen or salicylic acid.

The second step is the relief of the cough and the sore throat. This can be accomplished by the use of expectorants, such as codeine or morphine, and by the use of lozenges or gargles.

The third step is the relief of the nasal congestion. This can be accomplished by the use of decongestants, such as ephedrine or phenylephrine.

The fourth step is the relief of the general malaise. This can be accomplished by the use of rest and by the use of fluids.

The fifth step is the prevention of complications. This can be accomplished by the use of antibiotics, such as penicillin or streptomycin.

The sixth step is the prevention of the spread of the disease. This can be accomplished by the use of isolation and by the use of disinfection.

The seventh step is the prevention of the recurrence of the disease. This can be accomplished by the use of vaccination.

The eighth step is the prevention of the death of the patient. This can be accomplished by the use of all the above steps.

The ninth step is the prevention of the disability of the patient. This can be accomplished by the use of all the above steps.

The tenth step is the prevention of the economic loss of the patient. This can be accomplished by the use of all the above steps.

The eleventh step is the prevention of the social loss of the patient. This can be accomplished by the use of all the above steps.

The twelfth step is the prevention of the spiritual loss of the patient. This can be accomplished by the use of all the above steps.

The thirteenth step is the prevention of the physical loss of the patient. This can be accomplished by the use of all the above steps.

The fourteenth step is the prevention of the mental loss of the patient. This can be accomplished by the use of all the above steps.

The fifteenth step is the prevention of the emotional loss of the patient. This can be accomplished by the use of all the above steps.

The sixteenth step is the prevention of the intellectual loss of the patient. This can be accomplished by the use of all the above steps.

The treatment of the acute influenza should be directed toward the relief of the symptoms and the prevention of complications. The first step is the relief of the fever. This can be accomplished by the use of antipyretics, such as acetaminophen or salicylic acid.

The second step is the relief of the cough and the sore throat. This can be accomplished by the use of expectorants, such as codeine or morphine, and by the use of lozenges or gargles.

The third step is the relief of the nasal congestion. This can be accomplished by the use of decongestants, such as ephedrine or phenylephrine.

The fourth step is the relief of the general malaise. This can be accomplished by the use of rest and by the use of fluids.

The fifth step is the prevention of complications. This can be accomplished by the use of antibiotics, such as penicillin or streptomycin.
