NORTHWEST NEW MEDICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A packer leakage test shall be commenced on each multiply completed well within seven days after actual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all multiple completions within seven days following recompletion and/or chemical or fracture treatment, and whenever remedial work has been done on a well during which the packer or the rubing have been disturbed. Tests shall also be taken at any time that communication is suspected or when requested by the Division.
- At least 72 hours prior to the commencement of any packer leakage test, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.
- 3. The packer leakage test shall commence when both zones of the dual completion are shut-in for pressure stabilization. Both zones shall remain shut-in until the well-head pressure in each has stabilized, provided however, that they need not remain shut-in more than seven days.
- 4. For Flow Text No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other sone remains shar-in. Such text shall be continued for seven days in the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial pocker leakage text, a gas well is being flowed to the atmosphere due to the lack of a populine connection the flow period shall be three hours.
- Following completion of Flow Test No. 1, the well shall again be shor-in, in accordance with Paragraph 3 above.
- 6. Flow Ten'No. 2 shall be conducted even shough no leak was indicated during Flow Ton No. 1. Procedure for Flow Ten No. 2 is so be the same so for Flow Ten No. 1 energy

- that the previously produced zone shall remain shut-in while the zone which was previously shut-in is produced.
- 7. Pressures for gas-none tests must be measured on each zone with a deadweight pressure gauge at time intervals as follows: 3 hours tests: immediately prior to the beginning of each flow-period, as fifteen-minuse intervals during the first hour thereof, and at hourly intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period. 7-day certs: immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shown questionable test data.

24-hour oil some tests: all pressures, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be checked of least twice, once or the beginning and once at the end of each test, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas deal completion, the recording gauge shall be required on the oil sone only, with deadweight pressures as required above being taken on the gas sone.

8. The results of the above-described tests shall be filed in triplicate within 13 days after completion of the rest. Tests shall be filed with the Assec District Office of the New Mexico Oil Conservation Division on Northwest New Mexico Packer Leskage Test Form Revised 10-01-78 with all dendweight pressures indicated thereon as well as the flowing temperatures (gas assets only) and gravity and GOR (oil sones only).
