## NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

Tacker causes test shall be commenced on each multiply commenced well within seven days after an completion of the well, and annually thereafter as prescribed by the order authorizing the pace completion. Such tests shall also be connected on all multiple completions within seven eavy lowers recompletion and/or chemical or fracture treatment, and whenever remedial work has been only well during which the packer of the tuning have neen disturbed. Tests shall also be taken at low time that communication is suspected or when requested by the Division.

Wilcost 72 hours prior to the commencement of any nacker reakage test, the operator shall notify a revision in writing of the exact time the test is to be commenced. Offset operators shall also be so perced.

w macker leakage test shall commence when both zones of the dual completion are shuffin for possine studitization, both zones shall remain shuffin until the well-head pressure in each has numbered, provided however, that they need not remain shuffin more than seven days.

I now Test No. 1, one zone of the dual completion shall be produced at the normal rate of could on while the other zone remains shuffin. Such test shall be continued for seven days if the case of a last well and for 24 hours in the case of an oil well. Note if, on an initial packer leakage test, a last set is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall so time hours.

showing completion of flow Test No. . . the web shall again be shut-in, in accordance with fraginging 3 above.

— Flow Test No. 2 shall be conducted even though no leak was indicated during flow Test No. 3 movedure for Flow Test No. 2 is to be the same as for Flow Test No. 1.

- xucker causize test shall be commenced on each multiply completed well within seven days after expect that the previously produced zone shall remain southin while the zone which is completion of the well, and annually thereafter as prescribed by the order authorizing the
  - Pressures for gas-zone tests must be measured on each zone with a deadweight pressure gauge at time intervails as follows: Yours tests: immediately prior to the beginning of each flow-period, at fifteen minute intervals during the first hour thereof, and at hoursy intervals thereafter, noticing one pressure measurement immediately prior to the flow behood, at least one time during each flow heriod (at approximately the minimal point and uninequately prior to the conclusion of each flow period.) Other pressures may be facen, as desired, or may be requested on wells which have previously shown duestionable test late.
  - 14-hour oil zone tests: all pressures, throughout the entire test, shall be avoitinuously measured and recorded with recording pressure gauges the accuracy of a nion must be checked at least twice once at the negiming and once at the end of each test, with a deadweight pressure gauge. If a weil is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil zone only, with deadweight pressures as required above heing faxen on the gaz zone.
  - s. The results of the above described tests shall be filed in triplicate within 15 days after completion of the test. Tests shall be filed with the Aztec District Office of the New Mexico Oil Conservation Division of Northwest New Mexico Packer Leakage Test form Revised 10/01/78 with an deadweight pressures indicated nervon as well as the flowing temperatures (gas zones only) and gravity and GOR oil zones only).
