I have examined the application received on for the Meridian OPERATOR LEAS	Lill # / E & WELL NO.
UL-S-T-R and my recommenda	tions are as follows:
Yours truly,	
3-).	

MERIDIAN OIL

May 22, 1992

Mr. William J. LeMay N. M. Oil Conservation Division P. O. Box 2088 Santa Fe, N.M. 87501-2088

> Re: Angel Peak #1 DK/Gal 1150' FSL; 1090' FWL Section 2, T27N R11W San Juan County, N. M.

Dear Mr. LeMay:

Meridian Oil Inc. is applying for an administrative downhole commingling order for the referenced well in the Kutz Gallup and Basin Dakota fields. The ownership of the zones to be commingled is common. The offset operators and owners are Arco Oil and Gas Company, BHP Petroleum, Texaco Inc., Amoco Inc., Conoco Inc., and Meridian Oil. The Bureau of Land Management and these offset operators and owners will receive notification of this proposed downhole commingling.

This well has produced since 1960 from the Dakota interval. The Dakota experienced a normal production decline and is currently capable of producing 200 MCF/D & 1.0 BOPD. Its cumulative production is 6,228 MMCF & 56,758 BO as of January 1, 1992.

We propose to commingle the Dakota with the Gallup in this well. The Gallup is a very marginal producing interval and generally requires a pumping unit to lift the oil. The nearest offset, Pipkin #26 (E 12 27 11) initiated production at 8 BOPD and 75 MCF/D in 1989 and is currently capable of only 3 BOPD and 45 MCF/D. Commingling should enable the well to produce Gallup hydrocarbons without pumping equipment since the Dakota gas should be sufficient to lift the oil production. The small amount of oil and gas produced from the Gallup could not justify a drilling expenditure. Granting this application will be in the best interest of conservation, the prevention of waste, and the protection of correlative rights.

We plan to commingle this well by pulling the Dakota tubing, perforating and stimulating the Gallup, and

running a string of production tubing to the lower producing interval.

The reservoir characteristics of each of the subject zones are such that underground waste would not be caused by the proposed downhole commingling. The fluids from each zone are compatible and no precipitates will be formed to cause damage to either reservoir. See the attached fluid analyses from Hillside #1, a nearby Kutz Gallup-Basin Dakota well that was commingled on 12-17-91 (DHC-784) with no detrimental effects. The daily production will not exceed the limit of Rule 303c, Section 1a, Part 1.

The shut-in pressure for the Gallup is estimated to be 550 psi, and the Dakota shut-in pressure is 612 psi.

To allocate the commingled production to each of the zones, Meridian will consult with the District Supervisor of the Aztec District Office of the Division to determine an allocation formula for each of the productive zones. This will be done using flow tests from the Dakota and Gallup during recompletion operations.

Included with this letter is a plat showing ownership of offsetting leases, a copy of the letter to the offset operators and BLM, wellbore diagrams both before and after commingling, production curve for the Dakota, pertinent data sheet, and a detailed report of fluid compatibility.

Yours truly,

P. M. Pippin

Sr. Production Engineer

MERIDIAN OIL HILLSIDE #1 - GALLUP HILLSIDE #1 - DAKOTA LEASE FLUIDS

SUMMARY OF RESULTS

- No precipitation of materials was observed from either admixture of fluids.
- Emulsion testing was performed. There should be no serious concern over the formation of a stabilized emulsion at well bore temperatures.
- 3. The cloud point of oil mixtures dropped or remained the same upon mixing of fluids.
- 4. According to calculations not enough cool down from gas expansion will occur to alter paraffin deposition significantly.

MERIDIAN OIL
HILLSIDE #1 - GALLUP
HILLSIDE #1 - DAKOTA
LEASE FLUIDS

On Thursday, October 25, 1390, a request for laboratory work was placed by Mike Pippin, Petroleum Engineer of Meridian Oil, Inc.

PURPOSE

Two oil samples were received of Mr. Pippin with the request we investigate the concern of potentially detrimental effects due to commingling of Gallup and Dakota fluids in the Hillside #1 wellbore.

TNVESTIGATION

- 1. Background information current wellbore.
 - a. Figure 1
 - b. Figure 2
 - c. BHST Gradient: 1.375° f/100 ft.
 - d. Current production problems are primarily due to paraffin deposition from surface down to more/less 1000' depth.
 - e. Commingling Order Mixture Requirements:

The commingling requests present the mixing of Hillside #1 Dakota fluids with Hillside #1 Gallup fluids.

The tests performed simulated the mixture of fluids that may result from this commingling action. Each oil component was analyzed for API gravity, paraffin, pour point and cloud point. Each water component was analyzed for dissolved solids, pH, specific gravity and resistivity. The mixture of oils addressed the potential increase in precipitation of materials and the potential increase paraffin content by a synergistic effect of mixing oils of different constitution. Emulsion tests simulated the mixing environment of the wellbore where the water component of a fluid could be tied up in a resulting emulsion without the ability to break out and the oil and allow separation of constituents. The emulsion test results present the number of ml (% of mixture) of water breakout at listed time intervals. The volume of test sample (mixture) used in the emulsion tests is 100 ml.

- 2. Concerns to address in analysis:
 - a. The precipitation of materials produced by the admixture of oils of potentially different constitution.
 - b. The creation of emulsions due to the admixture of different fluids.
 - c. Increased paraffin deposition by additive properties of oils.
 - d. Increased paraffin deposition due to the reduction of temperature accompanying gas expansion.
- 3. Steps taken in analysis
 - a. API Analysis of oils including: API Gravity
 Pour Point
 Cloud Point
 Paraffin Content
 - b. Discussion with Mr. Pippen regarding the well bore production environment, e.g., mode of hydrocarbon production, pump type and operation, water components of production fluids, current paraffin problems, etc.
 - c. Mixing of oils in appropriate cases with additional cloud point testing to determine resulting fluid characteristics.
 - d. API Water Analysis
 - e. Emulsion tendency testing via mixing of fluids in appropriate cases.

CALCULATIONS

Cool down effects due to gas expansion:

Reference: Perry's Handbook of Chemical Engineering

RE: Adiabatic Expansion of Etane, Methane

$$T_s + T_r (\frac{P_s}{P_r}) (\frac{K-1}{K})$$
, where

T_S = Surface Temperature

T_ = Reservoir Temperature

P = Surface Pressure

P_r = Reservoir Pressure

K = Specific heat at constant pressure
Specific heat at constant volume

Assumed values for maximum cool down due to gas expansion:

T = Unknown

 $T_r = 160^{\circ} F$

P_s = 500 psi

 $P_{r} = 2000 \text{ psi}$

K = 1.2

0.1667

 $T_s = 160 \ (\frac{500}{2000})$

 $T_s = 127^{\circ}F$

NOTE:

A total cooldown of 33° F would be expected
