DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudding jobs, cementing points, and all other important proposed work)

It is proposed to drill a wildcat well to test the oil to an approximate depth of 3100', but continue to 3000', if oil is dry. Approximately 130' of surface casing will be set and cemented to the surface. If well is productive, 4-1/2" casing will be set through all possible pays. Since oil is prime objective, 6-log tests, core analysis, etc., will be made on it. If well should be drilled to 3000' into Harrison to approximately 3100' or less, no tests will be made on that portion. After logging and log evaluation, any indicated tests of the 3000' can be made.

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.
