NORTHWEST NEW MEDICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A packer leakage rest shall be commenced on each multiply completed well within seven dave after actual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all multiple completions within acven days following recompletion and/or chemical of fracture treatment, and whenever remedial work has been done on a well during which the packer or the tubing have been distracted. Texts shall also be taken as any time that commission is suspected or when requested by the Division.
- At least 72 hours prior to the commencement of any packer leakage test, the operator shall morely the Division in writing of the exact turns the test is to be commenced. Offset operators shall also be so notified.
- The packer leakage rem shall commence when both zones of the dual completion are shut-in for previous mabilization. Both zones shall remain shut-in until the well-head pressure in each has subblisted, provided however, that they need not remain shut-in more than owner days.
- 4. For Fire Test No. 1, one some of the dual completion shall be produced at the normal rate of production while the other some remains share-in; Such test shall be communed for seven dars in the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage test, a gas well in being flowed to the suncephere due to the lack of a pipeline connection the flow period shall be three hours.
- 5. Following completion of Flow Test No. 1, the well shall again be short-in, in accordance with Paragraph 3 above.
- 6. Flow Ten'No. 2 shall be conducted even though no leak was indicated during Flow Ten No. 1. Procedure for Flow Ten No. 2 is so be the same as for Flow Ten No. 1 except

- that the previously produced zone shall remain shot-in while the zone which was previously shot-in it produced.
- 7. Pressures for quescone rests must be measured on each some wish a deadweight pressure gauge as time intervals as follows: 3 hours tests: immediately prior to the beginning of each flow-persod, at faftern-missue intervals thating the first hours thereafter, including one pressure measurement immediately prior to the conclusion of each flow period, 7-day-true: immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shown questionable sest data.

24-hour oil zone resu: all pressures, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be checked at lensi twice, once at the beginning and once at the end of each east, with a deadweight pressure gauge. If a well is a gazel or an oil-que dead completion, the recording gauge wholl be required on the oil zone only, with deadweight pressures as required above being eaten on the gas mane.

8. The revults of the above-described sees shall be filed in triplicate within 15 days after completion of the test. Term shall be filed with the Aster District Office of the New Mexico Oil Conservation Division on Northwest New Mexico Packet Leshage Test Form Revised 10-01-78 with all deadweight pressures indicated thereon as well as the flowing a temperatures (gas some only) and gravity and GOE (oil some only).
