NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A paccer leakage test shall be commenced on each multiply completed well within seven days after actual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be connected on all multiple completion. Such tests shall also be connected on all multiple completion and/or chemical or fracture treatment, and wherever remailial work has been done on a well during which the packer or the tubing have been disjuring. Tests shall also be taken at any time that communication is suspected or when requested by the Division.

 2. At least 72 hours prior to the commencement of any pacific leakage test, the operator shall notify the
- At least 72 hours prior to the commencement of any pactor legicage tigst, the operator shall notify the Division in writing of the exact time the test is to bis commenced. Offset operators shall also be so notified.
- 3. The packer leakage test shall commence when high gones of the dual pompletion are shall in for pressure stabilization. both zones shall remain shall-in uptil the wall-head pressure in each has stabilized, provided however, that they need not remain shall-in mote time seven date.
- provided however, that they need not remain shall in more time sense days.

 4. For flow Test No. i, one zone of the dual competition shall be produced at the normal rate of production while the other zone remains shut-in. So the test shall be produced for seven days if the case of a gas well and for 24 hours in the case of an all well. Blote: if, on an initial packer leakage test, a gas well is being flowed to the atmosphere due to the last of a papeline commention, the flow period shall be three hours.
- 5. Following completion of flow Test No. 1, the wall shall again be shall in, in accordance with Paragraph 3 above.
- 6. Flow Test No. 2 shall be conducted even though no leak was indicated during flow Test No. 1. Procedure for Flow Test No. 2 is to be the same and for Flow Test No. $1\frac{1}{2}$

- except that the previously produced zone shall remain shut-in while the zone which was previously that in is produced.
- 7. Pressures for gas-zone tests must be measured on each zone with a deadweight pressure gauge at time intervals as follows: 3 hours tests: immediately prior α the beginning of each flow-period, at fifteen must entervals during the first hour thereof, and at higherly intervals thereafter, including one pressure measurement immediately prior to the flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of ratch flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shown questionable test data.
- 24-hour oil zeute tests: all pressures, throughout the entire test, shall be continuously neglected and recorded with recording pressure gauges the accuracy of which must be elected at test twice, once at the beginning and once at the end of each test, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil zone only, with deadweight pressures as required above being taken on the gaz zone.
- 8. The results of the above described tests shall be filed in triplicate within 15 days after completion of the test. Tests shall be filed with the Aztec District Office of the New Mexico Off Conservation Division of Northwest New Mexico Packer Leakage Test form Revision 10/01/78 with all deadweight pressures indicated thereon as well as the flowing unspersures (gas zones only) and gravity and GOR (oil zones only).
